1. About this release

RTM View Shell v1.0 is the secure management shell for a contact-centre real-time monitoring system. It manages users, permissions and dashboards, and provides the secure foundation — authentication, multi-tenancy, and a full audit trail — on which live data widgets and historical reports are delivered. It is built on .NET 8 and Blazor Server with PostgreSQL and Redis, and deploys to Windows Server.

2. What's delivered

- **Multi-tenant platform.** Many isolated organisations on one installation; per-tenant settings; a Superadmin who governs the platform; audited tenant switching.
- **User management.** Create, edit, block and reset users; roles (Superadmin, Administrator, Editor, Viewer); temporary-password onboarding; server-side paged, filterable lists.
- **Permission groups.** Granular access to menus, screens, queues, skills, business units and agent supergroups; empty-list-denies safe defaults; backend-enforced at every request.
- **Dashboard management + editor.** Create, rename, delete and search dashboards; per-group / public access; a screen editor with drag-and-drop layout, alignment guides, multi-select and grid.
- **Widgets + Info Slots.** Widget catalogue and rendered widgets; Info Slots for live on-screen messages.
- **Historical Reports.** Queue and agent reports (Queue Interval, Queue Wait Time, Agent Monthly, Agent Shift Detail) with date filters, permission-scoping, service-level threshold and export.
- **Secure authentication.** Hardened cookie sessions, e-mail two-factor, RSA-signed JWT for the REST API with rotation and reuse-detection, and per-tenant SSO configuration.
- **Full audit trail.** Append-only logging of every authentication, permission-change, and tenant action; viewable and exportable, with per-tenant retention.

3. Known limitations in v1.0

- Single Sign-On is configurable but federation is a stub in v1.0; users sign in with local accounts plus e-mail two-factor until the provider integration ships.
- Some report exports and the newest screen-editor refinements are being finalised; see the current known-issues list for details.

4. Compatibility

Area	Supported
Browsers	Chrome, Firefox, Edge (latest two); Safari 16+
Minimum resolution	1280×768; Viewer read-only on mobile (basic)
Runtime	.NET 8 (LTS)
Database	PostgreSQL 15+ (16/18 recommended)
Cache	Redis-compatible 7+ (Memurai / Garnet on Windows)
Hosting	Windows Server 2019 / 2022

5. Installation & upgrade

Installation and upgrade are scripted for Windows Server. The Installation & Deployment Guide (A-01) and the Upgrade & Patch Guide (A-09) cover first install and in-place updates; both are finalised against the confirmed production deployment.

6. The road ahead

- Live SSO federation (OIDC / SAML 2.0 / AD-LDAP) replacing the v1.0 stub.
- Continued reporting and widget enhancements.
- Operational tooling: backup/restore runbook, health and monitoring, cache migration (Garnet).

Security posture

The v1.0 security controls are summarised in the Security & Compliance Summary (D-02) and detailed in the Security Configuration Guide (A-04).

Appendix A — Feature status at a glance

Capability	Status in v1.0
Multi-tenant user & permission management	Delivered
Dashboard management + screen editor	Delivered
Widget rendering + Info Slots	Delivered
Historical Reports	Delivered (exports being finalised)
Secure auth (cookie, 2FA, JWT)	Delivered
Audit trail	Delivered
SSO live federation	Configurable; stub in v1.0
