
Security Awareness Briefing

How RTM View Shell keeps accounts and data safe — and your part in it

Why this matters

- RTM View Shell carries real-time contact-centre data for many organisations at once.
- Strong technical controls protect it — but people are part of every security system.
- This briefing covers the controls in place and the few habits that keep them effective.

Strong passwords

- At least 12 characters, mixing upper, lower, a digit and a special character.
- You can't reuse any of your last 10 passwords; they expire periodically.
- **Use a unique password you don't use anywhere else — it's the single biggest protection.**

Two-factor authentication

- After your password, a 6-digit code is e-mailed to you (valid 10 minutes).
- It means a stolen password alone is not enough to get in.
- Leave it on; your organisation may make it mandatory.
- **The code is only ever in the e-mail body — never share it.**

Single Sign-On

- Where offered, sign in with your corporate identity (OIDC / SAML / AD-LDAP).
- If your provider already did a multi-factor check, you won't be asked twice.
- Fewer passwords to manage — and centrally controlled by your organisation.

How attacks are blocked

- Five failed sign-ins lock the account for 15 minutes.
- The sign-in is rate-limited to slow automated guessing.
- **Every failure shows the same message — attackers can't tell what was wrong, nor enumerate accounts.**

Stay alert to phishing

- RTM View Shell only ever e-mails you a 2FA code or a password-reset link.
- It never asks for your password by e-mail or chat.
- **If a message asks for your password or pushes you to a strange site, stop and report it.**

Sessions & shared computers

- Your session signs you out automatically after a period of inactivity.
- **On a shared or public computer, always Sign out — don't just close the tab.**
- Signing out ends the session and clears your preferences from that browser.

Isolation & the audit trail

- Each organisation's data is isolated automatically — you only ever see your own tenant.
- Every sign-in and change is recorded in an append-only audit log (who, when, where).
- The log can't be edited or deleted — it's there to protect everyone.

Your responsibilities

- Pick a strong, unique password and keep two-factor on.
- Never share your password or 2FA code; be wary of unexpected links.
- Sign out on shared machines.
- Report anything that looks wrong to your administrator.

Key takeaways

- Strong unique password + two-factor = most of your protection.
- RTM View Shell never asks for your password — beware phishing.
- Sign out on shared computers.
- Everything is isolated and audited; report concerns.
