1. What Historical Reports are

Where the dashboards show you what is happening now, Historical Reports show you what happened over a chosen period — by queue and by agent. They read from RTM View Shell's stored history, so you can review a shift, a day, a month, or a custom range after the fact.

Where: open Reports from the navigation menu, or go to /reports.

You see only what you are allowed to

Reports are permission-scoped: you see data only for the queues (workgroups) and agents your permission group permits — exactly as on the dashboards. If a queue or agent you expect is missing, it is a permissions matter for your administrator.

2. The four reports

The Reports page has four tabs; select one, set the filters (section 3), and choose Apply:

Report	What it shows
Queue Interval	Queue activity broken into time intervals across the range — volumes and service measures per interval.
Queue Wait Time	How long callers waited in a queue, against the service-level target (see section 4).
Agent Monthly	Per-agent totals rolled up by month — a month-over-month view of each agent.
Agent Shift Detail	A detailed, per-shift breakdown for an agent — the finest-grained agent view.

3. Filtering a report

The filter bar at the top of each report controls what is included:

- **From / To** — the date range. The range is inclusive of today, so you can run a report up to and including the current day.
- **Workgroups** — limit the report to specific queues; leave it open to include all the queues you are permitted to see.
- **Agents** — on the agent reports, limit to specific agents.
- **Page size** — how many rows to show per page.

Set the filters and select Apply to run the report. Change any filter and Apply again to refresh.

4. Service level and the SL threshold

Queue reports measure service level against a target answer time — the service-level threshold. This threshold is set per organisation (the `SLThresholdSeconds` tenant setting) and expressed in seconds: a call answered within the threshold counts as within service level. If your service-level figures look unexpected, confirm the configured threshold with your administrator (see the Multi-Tenant Management Guide, A-07).

5. Reading and exporting results

Results appear as a paged table; use the page controls to move through large result sets. Reports can be exported for use outside the application; exports are capped at a maximum size per request to keep them responsive — narrow the date range or filters if an export is too large. Saved reports you no longer need are removed by a soft-delete, so they can be recovered within the retention window if removed by mistake.

6. Tips

- Start with a narrow date range and widen it once you have the right view — large ranges return more data and slower exports.
- Use the Workgroups and Agents filters to focus on exactly what you are investigating.
- For live, second-by-second monitoring use the dashboards (Dashboard Viewer Guide, B-05); use these reports for after-the-fact analysis.

Appendix A — Reports quick reference

You want to...	Do this
Open reports	Navigation → Reports (/reports)
Pick a report	Select a tab: Queue Interval · Queue Wait Time · Agent Monthly · Agent Shift Detail
Set the period	From / To dates (inclusive of today) → Apply
Focus on queues / agents	Use the Workgroups / Agents filters
Understand service level	SL is measured vs the per-tenant threshold (SIThresholdSeconds) — confirm with your admin
Get the data out	Export (capped per request; narrow filters if too large)

Conceptual companion: the *Unified Reporting Guide* explains how real-time and historical metrics relate on one data model.
